1. Vision & Category Positioning

1.1 What MyDriver Is

MyDriver is not a ride-hailing company.

	Uber / Rapido / Ola	MyDriver
What the customer lacks	A vehicle	A driver
What we supply	Car + driver	Driver only
Whose asset is at risk	The platform's / driver's	The customer's own car
Core anxiety	"Will I reach safely?"	"Will my car and my family reach safely – and what happens in between?"

That last row is the entire business. When a customer hands over their own car keys, the emotional stake is fundamentally different from booking a cab. **Nobody in India has built a product around that specific anxiety.**

1.2 Category Definition

MyDriver is a Trusted Driver-as-a-Service (DaaS) platform.

We do not move people. We move *trust*.

This positioning matters because it changes who we compete with, how we price, and what we are eventually acquired for. A driver marketplace is a low-margin commodity. A verified-trust infrastructure layer is not.

1.3 Vision Statement

"Your car. Your family. Your terms. Someone else drives."

2. The Problem We Are Actually Solving

The driver-on-demand market in India **has already solved supply**. DriveU has 100,000+ verified drivers and did ₹111.86 Cr gross platform revenue in FY25, profitably.

What nobody has solved is **visibility after the car leaves**.

The three failure moments

Moment 1 – 11:40 PM, Jubilee Hills.

A woman has had two drinks. She books a driver. He is a stranger, it is *her* car, and she is alone in the back seat. Her only safety tool is an SOS button she has to be conscious and calm enough to press.

Moment 2 – 6:10 AM, RGIA Departures.

₹300–500 a day for airport parking. She sends the car home with a driver instead – and then spends the entire flight with no idea where her car actually is, how it is being driven, or what condition it will be in.

Moment 3 – 4:30 PM, school / hospital run.

A driver takes her parents across the city. She gets a text on arrival. Everything between pickup and drop is a black box.

The gap in one line

Existing platforms give you **a moving dot on a map**.

A dot cannot tell you whether anything is wrong.

Our product is not "a driver app with tracking." It is **an accountability system that happens to include a driver**.

3. Use Cases (Test Cases)

These are the four scenarios the product must visibly win. If it does not win all four, it is not the product.

Test Case 01 – The Late-Night Ride **PRIMARY WEDGE**

Who: Women and young professionals returning from pubs, parties, late shifts in the IT corridor.

Fear: Being alone with a stranger, impaired, in her own car, at 1 AM.

What MyDriver does:

- Night trips are restricted to **Night Shield certified drivers** only (top-decile, 6+ months tenure, zero incidents)
- Live Guardian Link auto-shared with up to 3 trusted contacts
- Route-deviation and unscheduled-stop alerts pushed **to the guardians**, not just to her
- Silent SOS via triple volume-button press – no need to open the app
- Every active night trip is on a live board watched by a human at the 24×7 Safety Desk
- Safe-Arrival check-in loop after drop

Test Case 02 – The Airport / Empty-Car Drop **HIGHEST FREQUENCY**

Who: Frequent flyers avoiding ₹300–500/day parking. Also service-centre runs, car deliveries.

Fear: My car is out there alone with a stranger and I'm 35,000 feet up.

What MyDriver does:

- **Empty Car Mode** – a geofenced corridor is locked at trip start; any exit fires an immediate alert
- **Customer-set speed ceiling** – you set the number, breach pings you *and* the driver
- **Car Condition Capture** – 8-point timestamped, geotagged photo evidence of the car at pickup and at drop
- Fuel-level and odometer capture at both ends
- Trip Vault report emailed on completion

Test Case 03 – Family & Elderly **TRUST DRIVER**

Who: Parents, in-laws, dependents travelling without you.

Fear: Did they actually get in, get out, and get there? Was the driving safe?

What MyDriver does:

- Guardian Link with arrival confirmation
- **Driver Behaviour Score** derived from phone telematics (harsh braking, cornering, speeding, phone-use while driving) – visible *before* you accept the driver
- Repeat-driver preference – book the same trusted driver again
- Scheduled recurring bookings (school runs, dialysis, physio)

 **Legal note:** monitoring of passengers under 18 is restricted under DPDP Act 2023 Section 9(3). This use case launches as **elderly-and-adult first**, and the child-transport variant only after a written legal opinion. See §18.

Test Case 04 – Corporate Night Drop **REVENUE ANCHOR**

Who: IT / BPO / hospital employers who are already legally obliged to provide safe late-night transport.

Fear: Liability, and an audit trail they cannot produce.

What MyDriver does:

- Compliance-grade trip logs, exportable
- Transport-manager dashboard across all employees
- Contracted monthly volume – not one-off bookings
- Incident reports that stand up in an internal enquiry

Why this matters commercially: B2C night rides are high-emotion but low-frequency. Corporate contracts give us **guaranteed base volume from day one**, which solves the cold-start problem that kills most marketplaces.

4. Core USP – Phase 1 vs Phase 2

4.1 The strategic decision

The original plan led with the dashcam. **That was the right instinct and the wrong sequence.** Three reasons to move the camera to Phase 2:

1. **The camera is buyable.** KENT CamEye already sells live in-cabin video and GPS to any consumer off the shelf. Uber has already rolled out in-cabin recording in Hyderabad. Leading with the camera means leading with a commodity.
2. **The camera is the expensive, slow, legally hardest part.** Hardware CAPEX, 4G SIMs, streaming cost, DPDP consent architecture, driver resistance – all of it front-loaded before we know whether anyone will pay.
3. **The camera is not the moat anyway.** The moat is the *verification and escalation system around it* – and that system works perfectly well in Phase 1 with nothing but two smartphones.

Strategy: ship the trust layer first, add the lens second.

Phase 1 proves people pay for accountability. Phase 2 makes accountability visual.

4.2 USP summary

Phase 1 USP – "We watch the trip, not just the map."

- ✓ Verified & road-tested drivers, graded by car type
- ✓ **Dual-GPS Trip Integrity cross-check**
- ✓ **Guardian Link** with proactive anomaly alerts to trusted contacts
- ✓ **Live Driver Behaviour Score** from phone telematics
- ✓ **Customer-set speed ceiling**
- ✓ **Pickup Handshake** – OTP + live selfie match (stops ID substitution)
- ✓ **Car Condition Capture** – photo evidence at both ends

- ✓ **Night Shield protocol** + 24×7 human Safety Desk
- ✓ **Trip Vault** — tamper-evident, exportable trip record
- ✓ Structured escalation to law enforcement when required
- ✓ On-demand drivers within minutes
- ✓ Corporate driver solutions

Phase 2 USP — adds sight

- ✓ **MyDriver VisionCam** with **adaptive orientation** (see §6)
- ✓ Live road-view and configurable cabin view
- ✓ Camera-vs-phone GPS tamper detection
- ✓ Incident footage attached to the Trip Vault record

✗ **Removed from scope:** two-way live voice into the car. Third-party audio capture is the single highest legal exposure in this product and adds little the customer cannot get from a phone call. Cut it.

✗ **Removed from scope:** permanently inward-facing cabin camera. Replaced by the adaptive-orientation model in §6.

5. Phase 1: The Digital Guardian Stack

This is the answer to "what replaces the dashcam?"

Ten software-and-operations features. Zero hardware. All ten are things DriveU does not do today.

5.1 Dual-GPS Trip Integrity Engine ★ *core moat*

What it does: Continuously reconciles three signals — the driver's phone GPS, the customer's phone GPS (when riding), and the expected route baseline from the map engine.

It watches for:

- Route deviation beyond a tolerance corridor
- Unscheduled stops longer than 3 minutes
- Driver app force-closed, location permission revoked, phone powered off
- Speed sustained above the customer-set ceiling
- Trip start/end location mismatch against the booking

Escalation: in-app warning → SMS + IVR → Safety Desk human → structured escalation.

Why it's the moat: A safety feature the driver can silently switch off is theatre. A system where switching it off *is itself the alarm* is a safety product. This logic carries forward unchanged into Phase 2 – the camera simply becomes a fourth signal.

5.2 Guardian Link

What it does: At trip start, a live tracking link auto-goes to up to 3 pre-set contacts.

What makes it different from Uber's share-trip:

Uber gives your contact a link they have to *choose to look at*. Guardian Link **pushes alerts to the guardian**:

- "Trip started. Priya is in the car."
- "⚠️ Route deviation detected – 1.4 km off expected path."
- "⚠️ Car stationary for 6 minutes at an unscheduled location."
- "✅ Arrived. Priya confirmed safe."

Insight: the person most motivated to act is often not the passenger. It is the person waiting at home. Nobody is building for them.

5.3 Live Driver Behaviour Score

What it does: Uses the driver's phone accelerometer, gyroscope and GPS to score every trip on:

Signal	Detected via
Harsh braking / acceleration	Accelerometer delta
Aggressive cornering	Gyroscope
Overspeeding vs road limit	GPS + map speed-limit data
Phone handling while moving	Screen-on + motion correlation
Night fatigue pattern	Hours driven + micro-swerve detection

Rolls into a **0–100 MyDriver Score**, visible to the customer *before* they accept a driver, and to us for driver ranking and payout tiering.

Why it's different: DriveU has star ratings. Star ratings measure politeness. **This measures driving.**

5.4 Customer-Set Speed Ceiling

The customer sets a maximum speed at booking (e.g. 60 km/h in city, 90 on highway). Breach triggers:

1. Audible alert in the driver app immediately
2. Push notification to the customer
3. Logged permanently to the Trip Vault
4. Three breaches in a trip → auto-flag to Safety Desk

Works entirely off the driver's phone GPS. **Zero hardware.** This is the single highest-value feature for the airport and family use cases and it costs us nothing.

5.5 Pickup Handshake (Identity Lock)

The problem nobody talks about: a verified driver's account being used by an *unverified* person — a friend, a brother, a substitute. This is a real and documented failure in Indian driver platforms.

Our fix, at every single pickup:

1. Driver takes a **live selfie** in-app — liveness check, not an upload
2. Face-matched against the onboarding photo
3. Customer confirms a **4-digit OTP** with the driver
4. Trip cannot start until both pass

Result: we can honestly say *"the person driving your car is the person we verified."* DriveU cannot say that today.

5.6 Car Condition Capture

Before the trip starts and after it ends, the driver app forces an 8-point photo capture — timestamped, geotagged, non-uploadable-from-gallery:

Front · Rear · Left · Right · Dashboard (odometer + fuel) · Front seats ·
Rear seats · Boot

Protects the customer: proof of pre-existing vs new damage.

Protects the driver: proof he did not cause it.

Protects us: kills the single most common dispute in this business.

This also becomes the **Phase 2 bridge** — the same capture flow later runs on the VisionCam.

5.7 Night Shield Protocol (10 PM – 5 AM)

A hard operating protocol, not a feature toggle:

- Only **Night Shield certified** drivers are allocated (6+ months tenure, MyDriver Score ≥ 85 , zero open complaints, re-verified every 90 days)
- **Fitness check-in** at shift start — liveness selfie + a 10-second reaction test
- Every active night trip appears on the **Safety Desk live board**, watched by a human
- Guardian Link is **mandatory**, not optional
- Silent SOS via triple volume-button press
- Safe-Arrival check-in: if no confirmation within 10 minutes of drop, the Desk calls

This is the product for Test Case 01, and it needs no camera at all.

5.8 Trip Vault

Every trip generates an immutable, tamper-evident record:

Route polyline · Speed profile · All stops with duration
All alerts fired · Driver identity + selfie hash
Condition photos (before/after) · Odometer + fuel deltas
Payment record · Escalations, if any

Exportable as a signed PDF. **Retained 90 days by default, 24 months for corporate accounts.**

Why it matters: this is what makes us sellable to corporates, usable for insurance claims, and credible if a matter ever reaches the police. It is also, quietly, a defensible data asset.

5.9 Driver Grading & Skill Certification

Not one undifferentiated pool. Drivers are certified by capability:

Grade	Certification
MD-Standard	Manual hatchback / sedan
MD-Auto	Automatic transmission certified
MD-SUV	Large-body, high-clearance
MD-Lux	Luxury / premium marques
MD-EV	EV regen braking, charging etiquette
MD-Night	Night Shield certified
MD-Outstation	Long-haul, highway, multi-day

Each requires a physical road test at onboarding. Customer filters by grade. **Premium grades earn premium rates**, which is both a margin lever and a driver-retention lever.

5.10 Structured Escalation Framework

Replacing "GPS automatically goes to the police department" – which is legally incorrect and would get us sued – with a defensible ladder:

Level	Trigger	Action	Window
L0	Minor anomaly (small deviation, brief stop)	Silent log, in-app driver nudge	Instant
L1	Sustained anomaly / speed breach ×3	Driver push alert + customer notification	< 30 s
L2	No response / app disabled	SMS + automated IVR call to driver	< 90 s
L3	Still unresolved	Human Safety Desk agent calls driver and customer	< 3 min
L4	SOS pressed, or L3 unresolved	Guardian contacts alerted, live location shared	Immediate
L5	Verified emergency	Structured escalation to Dial 112 / T-Safe , Trip Vault packet released	Immediate

Two non-negotiables:

- **A human verifies before L5.** Automated police escalation on a GPS glitch is a defamation suit and a destroyed police relationship.
- **We do not claim a police "partnership" we do not have.** We say: "Emergency incidents are escalated to law enforcement through official channels when required."

5.11 Phase 1 – why this beats a dashcam-first launch

	Dashcam-first	Guardian Stack first
Time to launch	6–9 months	8–10 weeks
Capital before first revenue	₹40 L+	₹12 L
Legal complexity	Very high (DPDP, consent, audio)	Low–moderate
Driver resistance	High	Low
Copyable by DriveU	In one quarter	Needs an ops org, not a feature

	Dashcam-first	Guardian Stack first
Proves willingness to pay	No	Yes – the point of Phase 1

6. Phase 2: MyDriver VisionCam

6.1 The adaptive-orientation model

The original always-on inward camera is **removed**. Instead, a single motorised/repositionable dual-lens unit that the customer configures **per trip**:

Mode R – Road Only (*default*)

Camera faces forward. Cabin is not captured at all.

Use when: the owner is in the car and wants zero cabin recording.

Mode D – Driver Focus

Frame is tightened to the **driver's seat only**. Rear seats and passengers are outside the frame.

Use when: the owner or family are riding and want the driver accountable without being filmed themselves.

This is the direct answer to "if the owner doesn't want himself in the cam."

Mode F – Full Cabin

Wide interior framing showing the whole cabin.

Use when: the car is travelling **empty** – airport drop, service run, car delivery. No passenger to record, so full visibility of the car's interior and contents.

Mode-switch logic

Booking type = EMPTY CAR → default Mode F

Booking type = OWNER RIDING → default Mode D

Owner privacy toggle ON → force Mode R

Owner can change mode mid-trip, from the app, any time.

Every mode change is logged to the Trip Vault.

Critical design rule: the customer can *reduce* capture at any time. The driver can never change the mode. Only the Safety Desk can widen it, and only on a verified L4/L5 escalation.

6.2 What VisionCam does NOT do

- ✗ No two-way voice. Removed.
- ✗ No cabin audio recording of any kind.
- ✗ No 24×7 recording – streaming is **on-demand only**, when the customer opens the app.
- ✗ No footage retention beyond 14 days unless the trip is flagged.
- ✗ No mode the driver controls.

6.3 The device constraint that drives everything

Our driver drives a different customer's car on every single trip. An installed dashcam is impossible. The unit must therefore be:

- **Portable** – carried by the driver, car to car
- **Self-powered** – internal battery, 12V as backup
- **Self-connected** – its own 4G M2M SIM, independent of the customer's car
- **Fast-mounting** – suction/magnetic, under 90 seconds
- **Cheap enough to lose** – 10–15% annual loss/breakage must be survivable

Indicative unit cost ₹8,000–10,000 all-in (Qubo 4G Live class), plus ₹300–600/month per device for SIM, streaming and cloud.

6.4 VisionCam + the Integrity Engine

In Phase 2 the camera becomes a **fourth GPS signal**. The Integrity Engine now also detects: device powered off, SIM removed, lens obstructed, camera GPS diverging from phone GPS. Same escalation ladder, more signal. **The Phase 1 architecture does not get rebuilt – it gets extended.**

7. Application Ecosystem

7.1 Customer App

Module	Features
--------	----------

Module	Features
Booking	Instant / scheduled / recurring · Trip type (with-me, empty-car, outstation) · Driver grade filter
Safety	Guardian Link setup · Speed ceiling · Silent SOS · Safe-arrival check-in · Live board
Trust	Driver profile, MyDriver Score, behaviour history · Verified badge · Repeat-driver booking
Trip	Live map · Condition photos · Alerts feed · (P2) live view
Records	Trip Vault archive · Exportable reports · Invoices
Money	UPI / card / wallet · Corporate billing · Insurance add-on

7.2 Driver App

Module	Features
Work	Accept/reject · Navigation · Shift & attendance · Earnings dashboard
Compliance	Pickup handshake (selfie + OTP) · Condition capture · Fitness check-in
Performance	MyDriver Score with breakdown · Grade progress · Incentive tracker
Support	Emergency reporting · Breakdown assistance · In-app grievance

Transparency principle: the driver sees exactly what the customer sees about him. Nothing about the monitoring is hidden. Covert monitoring is both a legal risk and a driver-churn engine.

7.3 Agent App (*field recruitment*)

Recruit drivers · Capture and verify documents · Schedule road tests · Track referral payouts · Territory targets

7.4 Admin CRM – *the Control Room*

Section	Contents
Dashboard	Live trips · Daily/monthly revenue · Active drivers · Bookings · Customer growth
Safety Desk	Live night board · Open alerts · Escalation queue · SOS handling
Analytics	Top/bottom drivers · Cancellation rate · Retention cohorts · Demand heatmap · Utilisation

Section	Contents
Operations	Driver verification queue · Complaint management · Grade certification
Finance	Driver payouts · Revenue · Corporate billing · Commission reconciliation
Compliance	Consent records · Data retention · Trip Vault access log

7.5 Safety Desk (a room, not a screen)

Staffed 24×7 from launch. Not a call centre – an **active monitoring desk** with a live board of every night trip and a hard SLA of 3 minutes from L2 to human contact. This is the most under-appreciated line item in the budget and the one that actually delivers the USP.

8. Complete Operational Workflows

8.1 Driver Onboarding

↓

ACTIVATION

Target: 5-7 days. Cost: ~₹4,500/driver.

8.2 Customer Onboarding

Install → Mobile OTP → Profile → Vehicle registration (make, model, transmission, reg no.)

→ Guardian contacts setup → Safety preferences (speed ceiling, default mode)

→ Payment method → READY

8.3 Trip Lifecycle

1. Booking placed (instant / scheduled)
2. Allocation engine matches by: proximity · grade match to vehicle · MyDriver Score
· night certification (if applicable) · repeat preference
3. Driver accepts → customer sees profile, score, ETA, photo
4. Driver arrives → PICKUP HANDSHAKE (selfie liveness + OTP)
5. CAR CONDITION CAPTURE – 8 points + odometer + fuel
6. Guardian Link fires to trusted contacts
7. TRIP LIVE → Integrity Engine active · speed ceiling armed
· behaviour telemetry recording [P2: VisionCam armed in selected mode]
8. Any anomaly → escalation ladder L0→L5
9. Drop → CONDITION CAPTURE (after) + odometer + fuel
10. Payment settlement → driver payout queued
11. Safe-arrival check-in → guardian "arrived" notification
12. Trip Vault sealed · rating collected · MyDriver Score updated

8.4 Incident Workflow

Trigger (auto-detected OR SOS OR customer report)

↓

Safety Desk agent assumes ownership within 90 seconds

↓

Verify: call driver → call customer → check live signals

9. Safety & Escalation Model

9.1 Driver Safety Kit

Item	Phase
Photo ID card with QR verification	P1
MyDriver app with GPS + telematics	P1
Phone mount + charger	P1
Emergency support line, 24×7	P1
Accident & liability cover	P1
Uniform	P1
VisionCam unit	P2

9.2 Customer Safety Stack

Layer	Delivered by
Pre-trip	Background-verified driver · Grade certification · Visible MyDriver Score
At pickup	Selfie liveness + OTP handshake · Condition capture
In-trip	Guardian Link · Integrity Engine · Speed ceiling · Silent SOS · Live board
Post-trip	Safe-arrival check-in · Condition capture · Trip Vault

Layer	Delivered by
If it goes wrong	3-minute human SLA · L0-L5 ladder · Insurance cover · Evidence packet

9.3 Language discipline

❌ Never say	✅ Always say
"GPS automatically goes to the police"	"Emergency incidents are escalated to law enforcement through official channels when required."
"We partner with the police"	"We maintain a structured escalation route via Dial 112."
"We record everything"	"Recording is on-demand, mode-controlled by you, and auto-deleted in 14 days."
"100% safe"	"Every trip is monitored, logged and auditable."

Reason: the first column creates legal liability and, worse, will get us ignored by the actual police the first time we cry wolf.

10. Business Structure & Departments

Department	Charter	Phase 1 headcount
Operations	Driver supply, allocation, Safety Desk , complaints, emergency handling	1 lead + 4 desk agents
Sales	Corporate contracts – IT parks, hospitals, hotels, event companies	1
Business Analysis	Revenue, utilisation, demand forecasting, expansion modelling	1 (initially the Business Head)
Technology	Customer/Driver/Agent apps, CRM, Integrity Engine, infra	3 engineers

Department	Charter	Phase 1 headcount
Quality & Testing	App QA, driver verification audits, mystery rides, CX monitoring	0.5 (shared)
Marketing	Digital, influencer, outdoor, PR, community	1

Phase 1 total: 11–12 people. The Safety Desk is 4 of them and is non-negotiable – it *is* the product.

11. Revenue Model

Stream 1 – Trip Commission (core)

	Amount
Trip value	₹537
Driver receives (78%)	₹419
MyDriver commission (22%)	₹118

Stream 2 – Guardian Safety Fee ★ *the differentiator, monetised*

Phase	Fee	What it buys
Phase 1	₹49 / trip	Guardian Link, Integrity Engine, speed ceiling, Trip Vault, Night Shield
Phase 2	₹99 / trip	All of the above + live VisionCam

This is the most important number in the business. If customers will not pay ₹49 for accountability, the entire thesis is wrong – and Phase 1 exists precisely to find that out for ₹12 lakh instead of ₹1.75 crore.

Stream 3 – Corporate Contracts

Client type	Monthly value
Startup / small office	₹30,000 – 60,000
Mid-size IT / BPO	₹60,000 – 1,50,000

Client type	Monthly value
Large MNC / hospital chain	₹1,50,000 – 3,00,000

Recurring, contracted, low CAC, high retention. **Target: 35% of Year-2 volume.**

Stream 4 – Monthly Personal Driver Plans

Plan	Price	Our margin
26 days, 8 hrs/day	₹18,000 – 22,000	₹3,000 – 4,000
26 days, 12 hrs/day	₹25,000 – 32,000	₹4,500 – 6,000
Executive / MD-Lux	₹35,000 – 45,000	₹7,000 – 9,000

Stream 5 – Driver Subscription

MyDriver Pro – ₹499/month. Priority allocation, higher search visibility, premium-grade access, faster payout cycle, free grade re-certification.

At 400 drivers with 30% uptake = ₹60,000/month recurring at near-zero marginal cost.

Stream 6 – Driver Registration & Verification Fee

₹500 – ₹1,500 one-time. **Recover cost, do not profit** – a high fee is the single biggest brake on driver supply, and supply is the harder side of this marketplace.

Stream 7 – Night & Premium Charges

Slot	Premium
10 PM – 5 AM	+₹150 flat
Festival / peak	+25%
Outstation	₹1,199 first 24 h, ₹549 per 12 h thereafter
Event / wedding / VIP	₹2,500 – ₹5,000 per day

Stream 8 – Insurance Attach

Per-trip cover at ₹15–99, commission-shared with the underwriter. Also **hard-bundled into corporate contracts**.

Stream 9 – Airport Package

₹349 flat for a one-way empty-car drop within ORR. Cheaper than two days of parking, and it is the highest-frequency repeat behaviour in the whole product.

12. Unit Economics

12.1 Phase 1 – one 3-hour night trip

Line	Amount
Driver fare (₹129/hr × 3)	+₹387
Night charge	+₹150
Guardian safety fee	+₹49
Customer pays	₹586
Driver payout (78% of fare)	−₹419
Gross platform revenue	₹167
Payment gateway (2%)	−₹12
Ops & Safety Desk allocation	−₹25
Cloud, maps, SMS/IVR	−₹4
CONTRIBUTION PER TRIP	₹126

12.2 Phase 2 – same trip, with VisionCam

Line	Amount
Fare + night + ₹99 safety fee	₹636
Driver payout	−₹419
Gross platform revenue	₹217

Line	Amount
VisionCam amortisation + 4G data	-₹26
Payment gateway (2%)	-₹13
Ops & Safety Desk allocation	-₹25
CONTRIBUTION PER TRIP	₹153

VisionCam payback: ₹9,000 device ÷ ₹73 net incremental fee ≈ **123 fee-paying trips ≈ 2-3 months** per active driver.

12.3 Break-even

	Phase 1	Phase 2
Fixed cost / month	₹5.0 L	₹8.5 L
Contribution / trip	₹126	₹153
Trips needed / month	~3,970	~5,560
Trips needed / day	~132	~185
Active drivers needed @ 2 trips/day	~66	~93

~66 drivers in one micro-market. Demanding but achievable — which is exactly why we start in five neighbourhoods and not across Hyderabad.

12.4 Correcting the original projection

The original document stated: $50 \text{ drivers} \times 10 \text{ trips/day} \times ₹80 = ₹40,000/\text{day}$, then concluded monthly revenue "can cross ₹1 lakh."

Two errors:

1. ₹40,000/day is **₹12 lakh/month**, not ₹1 lakh — a 12× arithmetic gap.
2. **10 trips per driver per day is not achievable.** A hired-driver trip averages 3 hours. Ten of them is 30 hours in a day. Realistic month-1 utilisation is **1-1.5 trips per driver per day**.

Honest Month 1: $50 \text{ drivers} \times 1.2 \text{ trips} = 60 \text{ trips/day} \times ₹126 \text{ contribution} \approx ₹7,560/\text{day} \approx ₹2.3 \text{ lakh/month}$. Plan on that. Building a budget on the fantasy number is how startups run out of money in month 7.

13. Pricing Architecture

Service	Price
Hourly (standard)	₹129/hr, 2 hr minimum
Hourly (MD-Lux / MD-SUV)	₹179/hr
Night surcharge (10 PM-5 AM)	+₹150 flat
Guardian safety fee	₹49 (P1) / ₹99 (P2)
Airport empty-car drop (within ORR)	₹349 flat
Outstation	₹1,199 first 24 h, ₹549 / 12 h after
Monthly personal driver	₹18,000 – 45,000
Event / wedding driver	₹2,500 – 5,000 / day
Per-trip insurance	₹15 – 99

Pricing principle: match DriveU on the base fare, win on the safety layer. We do not compete on being cheaper. We compete on being the one you use when it matters.

14. Initial Investment & Budget

14.1 Three funding tiers (18-month runway)

Tier	Amount	What it buys
LEAN	₹90 L	Founders unpaid · 2 engineers · 50 drivers · Phase 1 only · one micro-market · 12-month runway
REALISTIC ★	₹1.75 Cr	11-12 person team · 400 drivers onboarded · Phase 1 + Phase 2 rollout · 150 VisionCams · full compliance · 18-month runway
COMFORTABLE	₹3.4 Cr	Marketing headroom · 500 devices · second-city groundwork · aggregator-licence buffer · 24-month runway

14.2 The ₹1.75 Cr, itemised

Line item	Amount	%	Notes
-----------	--------	---	-------

Line item	Amount	%	Notes
Team & salaries (18 mo)	₹95 L	54%	11–12 people incl. 4 Safety Desk agents
Driver acquisition & vetting	₹18 L	10%	400 drivers × ~₹4,500
Marketing & launch incentives	₹15 L	9%	Cold-start supply incentives + first 5,000 customers
VisionCam hardware (Phase 2)	₹14 L	8%	150 units + 15% spares + mounts
Legal, compliance & insurance	₹10 L	6%	DPDP consent architecture, DPO, entity, liability cover
Tech, cloud, SIM, maps	₹9 L	5%	Mappls/Ola Maps, M2M SIMs, streaming, storage
Working capital float	₹8 L	5%	Driver payouts run ahead of collections
Contingency	₹6 L	3%	Thin by design — Phase 0 de-risks
TOTAL	₹1.75 Cr	100%	

14.3 Phase 0 — the only money you actually commit today

₹12 lakh. Two months. No hardware. The Guardian Stack MVP with 20–30 drivers in one micro-market, to answer one question: **will people pay ₹49?**

If the answer is no, we have lost ₹12 L instead of ₹1.75 Cr. **That is the single most valuable line in this document.**

15. Revenue Projections & ROI

15.1 Three-year projection (*conservative*)

	Trips	GMV	Net Revenue	EBITDA
Year 1 — 100 drivers, 1 city	33,300	₹2.0 Cr	₹0.60 Cr	–₹0.35 Cr
Year 2 — 400 drivers, 1 city	1,46,000	₹9.3 Cr	₹3.17 Cr	+₹0.40 Cr
Year 3 — 2 cities	3,28,500	₹20.9 Cr	₹7.13 Cr	+₹2.05 Cr

Sanity check: DriveU took 10 years to reach ₹112 Cr GPR across 11 cities. Our Year-3 figure is roughly one-fifth of that, in two cities. Ambitious — not fantasy.

15.2 ROI

Metric	Value
Capital deployed	₹1.75 Cr
Cash-flow break-even	Month 20
Cumulative EBITDA positive	Month 31
3-year cumulative EBITDA	₹2.11 Cr (1.2× capital, in cash)
Year-3 EBITDA run rate	₹2.05 Cr
Indian mobility multiple	8–12× EBITDA
Implied enterprise value	₹16 – 24 Cr
Return on equity, 3 years	≈ 9× – 13×

And the downside: capped at **₹12 lakh** if the Phase 0 gate fails. Asymmetric — which is the only kind of bet worth taking.

16. Roadmap & Time to Succeed

Phase 0 — VALIDATE · Month 0–2 · ₹12 L

- Guardian Stack MVP: Customer app + Driver app + basic CRM
- 20–30 drivers, ONE micro-market (Gachibowli–Madhapur–HITEC City)
- A/B price test the safety fee at ₹49 / ₹99 / ₹149
- Target: **40% attach rate**
- Legal opinion on MVAG scope + DPDP consent architecture
- **GO / NO-GO GATE AT MONTH 3**

Phase 1 — BUILD · Month 3–9 · ₹65 L

- Full Guardian Stack shipped, all 10 features
- 100 active drivers, five neighbourhoods
- 24×7 Safety Desk live

- 2 corporate contracts signed
- Dial 112 / T-Safe escalation route formalised
- Airport empty-car package launched

Phase 2 – VISION · Month 10–18 · ₹98 L

- VisionCam rolled out with adaptive orientation
- Safety fee moves ₹49 → ₹99
- 300–400 active drivers
- Family & elderly use case launched (post legal clearance)
- **Cash-flow break-even ~ Month 20**

Phase 3 – EXPAND · Month 19–36

- Second city (Bengaluru or Vizag)
- Monthly driver plans and fleet management at scale
- Telangana-wide, 500+ drivers
- Own driver ecosystem: personal · corporate · chauffeur · event · rental

17. Metrics & Business Analyst Charter

17.1 The 8 numbers that matter

Metric	Target
Trips per active driver per day	≥ 2.0
Safety-fee attach rate	≥ 40% ← <i>the single most important number</i>
Driver 90-day retention	≥ 65%
Customer repeat rate (90 days)	≥ 45%
Average allocation time	< 8 min
L2→human escalation SLA	< 3 min
Contribution per trip	≥ ₹126
Corporate share of volume	≥ 35% by Y2

17.2 Daily rhythm

Morning — previous-day revenue · driver attendance · active supply · missed & cancelled bookings · open escalations

Afternoon — demand heatmap by area/hour · supply gaps · allocation-time outliers · driver score movements

Evening — revenue close · complaints · CX feedback · Safety Desk incident log

Weekly — cohort retention · utilisation by grade · corporate pipeline · revenue forecast · expansion recommendation

18. Risk, Legal & Compliance

Risk	Severity	Mitigation
Nobody pays the safety fee	FATAL	Phase 0 price test before any hardware spend. Hard gate at month 3.
DPDP Act §9(3) — bans behavioural monitoring of minors, penalties to ₹200 Cr	HIGH	Child-transport variant does not launch without written counsel. Elderly/adult first.
MVAG 2025 aggregator scope — possible ₹5 L licence + up to ₹50 L deposit	HIGH	Legal opinion in Phase 0. Budget buffer in the Comfortable tier.
Passenger consent for recording (P2)	HIGH	Explicit per-trip in-app consent. Mode R default. No audio at all. 14-day auto-delete.
False escalation → defamation claim	HIGH	Human verification mandatory before L5. Never automated.
Driver resistance to monitoring	MEDIUM	Consent at onboarding, full transparency, premium pay for certified grades.
Telangana gig-worker welfare cess (1-2% of payouts)	MEDIUM	Model it into payouts from day one.
Insurance dispute on a hired driver	MEDIUM	Per-trip cover bundled. Condition Capture as evidence.
DriveU copies the feature set	MEDIUM	Compete on the Safety Desk, escalation route and corporate contracts — an ops org, not a feature.
Network dead zones	LOW-MED	Local buffering, graceful degradation to GPS-only, offline queue.

Compliance checklist before launch

- ☐ Private Limited incorporation · GST · trademark
- ☐ DPDP consent architecture + privacy policy + retention schedule
- ☐ Data Protection Officer appointed
- ☐ Written legal opinion: MVAG scope for a driver-only marketplace
- ☐ Driver monitoring consent forms
- ☐ Per-trip insurance product agreement
- ☐ Escalation SOP documented and Safety Desk trained
- ☐ Telangana RTO position on commercial-badge requirement

19. 3-Year Vision

Phase	Geography	Drivers	Milestone
1	Hyderabad, 5 neighbourhoods	100	Guardian Stack proven, fee attach validated
2	Hyderabad city-wide	400	VisionCam live, cash-flow break-even
3	Telangana + 1 city	1,000	Multi-city ops, corporate at scale
4	South India	5,000	Full DaaS ecosystem

The Phase 4 ecosystem

Personal drivers · Corporate driver fleets · Chauffeur services · Event & wedding drivers · Driver rental for fleet operators · Driver training academy · Verified-driver data & scoring as a licensable layer

The long game: MyDriver's real asset at scale is not the driver pool — it is **the verified driving-behaviour dataset and the trust infrastructure**. That is what insurers, fleet operators and eventually ride-hailing platforms will pay for.

20. The Next 60 Days

#	Action	Detail
1	Ship the Guardian Stack MVP	Customer app, Driver app, basic CRM. 8 weeks. No hardware.
2	Recruit 20–30 drivers	One micro-market. Full onboarding pipeline, road tests included.

#	Action	Detail
3	Price-test the safety fee	A/B ₹49 / ₹99 / ₹149. Target 40% attach. This is the whole experiment.
4	Sign 2 corporate pilots	IT/BPO night drops. Guaranteed base volume from day one.
5	Get the legal opinion	MVAG scope + DPDP consent architecture + child-transport position.
6	Open the police conversation	Formalise the Dial 112 / T-Safe escalation route.
7	Stand up the Safety Desk	Even at 2 agents. Write the SOP. Run drills.

The gate

Month 3. Two questions.

- 1. Do at least 40% of customers pay the safety fee?**
- 2. Can we reach 2 trips per driver per day in one micro-market?**

Both yes → release the ₹1.75 Cr.

Either no → stop, having spent ₹12 lakh.

All figures are bottom-up planning estimates for Hyderabad, 2026, built from public competitor filings and vendor pricing. Vendor quotes will move hardware numbers by 10–20%. Legal positions require confirmation by counsel before launch.
